The content hash above covers the canonical source of this document and was computed before it was injected, so it is checkable from the page. The artifact hash covers the rendered file's bytes and therefore cannot appear inside it — it ships in the sidecar, in `sha256sum -c` format. Neither hash says anything about whether the contents are true.

0.2 · MODEL_CHANGE

Audit object, not narrative — `AAA::EDITION_RENDER_CONTRACT::v1.3` §1. Computed at render from CHRON episodes `function=learn` + `AAA/eurekas/eureka-entries.jsonl`, over the registry seeded from the canon. A status is asserted only where a source declares one; **7** of **11** row(s) carry `n/a (unmeasured)` because no source measured one (Peraturan Sifar #5). Receipt counter = render-time row count: **11** at 2026-10-11T22:07:15Z.

0.3 · PREDICTION_LINEAGE

Computed at render from `chron/data/predictions.jsonl` (chron/data/predictions.jsonl), 109 row(s) read. Consequence joined from `AAA/scripts/chron_events.json` by `source_id`. TOP-5 per ordering, over unresolved rows only (ACTIVE / UNBOUND).

Lineage status census (all rows)

lineage status	rows	store status behind it (verbatim)
OPEN	94	ACTIVE=65, UNBOUND=29
VERIFIED	7	CORRECT=1, VERIFIED=6
FALSIFIED	2	INCORRECT=2
SPLIT	0	—
UNMAPPED	6	SUPERSEDED=3, VOIDED_SECTION_12=3

Mapping is printed rather than assumed: ACTIVE→OPEN; CORRECT→VERIFIED; INCORRECT→FALSIFIED; SPLIT→SPLIT; UNBOUND→OPEN; VERIFIED→VERIFIED; any other store status → UNMAPPED and shown verbatim. An unmapped state is not folded into OPEN — malformed, denied and absent are different facts.

0.4 · SURVIVORS_AND_NEWCOMERS

Name + age in days, computed from `created_at` on unresolved rows of `chron/data/predictions.jsonl` against the edition date 2026-10-12. Rule, printed not implied: **newcomer** = age ≤ 7 d; **survivor** = older than that and still unresolved. A row with no parseable `created_at` renders `n/a (unmeasured)` — it is never counted as age 0.

SOT read at render: `chron/data/calibration.json`, `updated_at 2026-10-10T23:15:25.864680Z`, edition date 2026-10-12. Every value above is a pass-through of that file — this renderer computes no metric of its own and caches none (Peraturan Sifar #4).

> **bias** — rendered as formula and sign only. The renderer does not interpret the direction in prose (Peraturan Sifar #6; the direction error was made 3× in one day, registry MC-001).
>
> `bias = confidence - accuracy`
>
> `0.682 - 0.863 =` **`-0.181`**
>
> `sign = NEGATIVE`
>
> Canon legend, quoted not paraphrased: “bias = confidence − accuracy. Tanda negatif = UNDER-confident (keyakinan di bawah ketepatan).”

> **Headline vs chance:** `BSS = (0.25 - 0.153) / 0.25 = 0.387` — roughly 40% better than a coin flip, at the n shown above.
>
> **No reliability diagram is rendered, deliberately.** With 25 effective observations across 10 bins most bins would hold ≤3

points, so the curve would be noise presented as a measurement. The honest form at this n is the per-row-n table above (proposal §8.2). Adopt a diagram only once verified n reaches the floor.

Honest scopes (the SOT's own, each with its n)

scope	n	correct	incorrect	mixed	accuracy	mean_brier

canonical_unified_excluding_self_tests	24	18	2	4	0.858	0.159
gold_pair_scope	1	0	0	1	0.500	0.182

error classes in the SOT: NONE=19, UNKNOWN=2 — no skill-attributable class is present, which is the blindness the blind-share below measures.

confidence_proposed and confidence_calibrated — two columns, never one

quantity	value	n
mean confidence_proposed (as authored)	**0.645**	75
mean confidence_calibrated (as emitted)	**0.581**	75
spread (max-min) confidence_proposed	0.750	75

spread loss = 1 - (spread_calibrated / spread_proposed)	**0.389**	75
mean |proposed - calibrated|	0.086	75
rows carrying proposed with no calibrated value	0	109 rows read

Both columns are printed because collapsing them into one number launders the shrinkage the recalibration step applies (proposal §1.5, ISSUE-005). Recomputed from `chron/data/predictions.jsonl` at this render, not quoted from an earlier edition.

lesson status: CANDIDATE=3, DIAGNOSTIC=3, SUPERSEDED=2, UNDECLARED=8 · error_type: ASSUMPTION_ERROR=1, MODEL_ERROR=1, RANGE_STALE_AT_MINT=1, REGIME_CHANGE=1, UNKNOWN=4, UNTYPED=8

blind_share — the contract's formula, rendered literally: `blind_share = lessons_actionable / lessons_total = 2 / 16 = 0.125`

Complementary count, printed beside it so the formula cannot be misread: `non_actionable_share = (lessons_total - lessons_actionable) / lessons_total = 14 / 16 = 0.875`

Contradiction preserved, not smoothed: the canon names the ratio `lessons_actionable / lessons_total` "blind-share", while its own worked example ("10/13 blind") counts the *non*-actionable side. Both readings are printed; the renderer picks neither, because choosing would be an interpretation the source does not support.
